II. Read the following passage and answer the questions that follow:

5X1=5

As cases of coronavirus COVID-19 are rising in the country, social media accounts are abuzz with several messages about the deadly virus, but many of these information are baseless. Infection: The virus infects the epithelial cells in the throat and lungs. The virus enters through the by nasal passage, eyes and mouth. Our hands are the main instruments that take the virus to reach our mouth, nose and eyes. Washing hands with soap water for 20 seconds as often as possible helps prevent the infection. Infectious period: Length of time an individual can transmit the infection to others is not known precisely, but possibly up to 10-14 days. Artificially reducing the contagious period is a crucial method of reducing overall transmission. Hospitalisation, isolation, lockdown and quarantine are all effective methods. Who can infect: Anyone infected with the virus can infect even before the symptoms appear. Most carriers do not even show signs. Covering our mouth and nose when we cough or sneeze will help reduce the infection. The virus is present in the saliva, sputum and faeces of the infected person for the whole infectious period.

1. Which cells are infected due to Covid?
2. What are ways for virus to enter into human body?
3. What are the effective ways to contain Covid-19?
4. Where can the virus be located in the person?
5. Give three side-headings under which the passage can be arranged.

5 . Read the following passage and make notes.

Coronaviruses were discovered in the 1960s. They are a group of viruses that cause diseases in mammals and birds. In humans, coronaviruses cause respiratory tract infections that are typically mild, such as the common cold. The name "coronavirus" is derived from the Latin *corona*, meaning crown or halo. The name refers to the characteristic appearance of the infective form of the virus, which is reminiscent of a crown or a solar corona. At the end of 2019, a new type of coronavirus started spreading in China. This type of coronavirus is often called 2019-nCoV, *novel coronavirus*, or *COVID-19*. It is believed that the virus was transmitted from animals to humans. Some of the symptoms of the coronavirus are fever, cough, runny nose, sore throat, headache, and trouble breathing. These symptoms are very much like those people have with a cold or the flu. The virus can be more serious in some people, especially if they are sick or have health problems. The virus appears to spread mainly from person to person. The transmission occurs when someone comes into contact with an infected person. For example, a cough, sneeze or handshake could cause transmission. The spread may also be caused by coming into contact with something an infected person has touched and then touching your mouth, nose or eyes. There is no specific vaccine or medication to cure the disease, but generally, symptoms will go away on their own. However, experts recommend seeking medical care early if symptoms feel worse than a standard cold. Doctors can relieve symptoms by prescribing pain or fever medication. As far as antibiotics are concerned, they are useless to treat coronavirus.

6. Assume you are a student having a telephone conversation with your class teacher regarding your doubt clarifications about writing an online exam since you are taking an online exam for the first time.
